

Retail store data analysis

🔴 Problem Statement

Retail businesses generate large volumes of sales data across multiple regions, customer segments, and sales channels. However, without proper analysis, it becomes difficult to identify key performance trends, customer behavior patterns, and high-performing areas.

This project aims to analysis retail sales data and build an interactive dashboard in Microsoft Excel to track performance, uncover insights, and support data-driven decision-making.

🎯 Objective

To design an interactive Excel dashboard that provides clear insights into sales performance, customer behavior, and operational efficiency.

? Business Questions

📊 Sales Performance

- What is the overall trend of sales and orders over time?
- Which months have the highest and lowest sales?

🌍 Regional Analysis

- Which states are generating the highest sales?
- Are there specific regions that consistently outperform others?

👤 Customer Insights

- Which gender contributes more to total sales?
- Which age group generates the highest revenue?

🛒 Product & Category Analysis

- Which product categories contribute the most to sales?
- Are there categories with high sales but potential for improvement?

📦 Order & Operations

- What percentage of orders are successfully delivered?
- What is the distribution of cancelled and returned orders?

📈 Sales Channel Performance

- Which sales channels (Amazon, Flipkart, Myntra, etc.) generate the most revenue?
